1 Background and Introduction

1.1 Survey Project Team

The Mid St Georges Channel survey (CEND0513) was carried out between 1st May and 6th May 2013 on the RV *CEFAS Endeavour* cruise CEND0513. The survey team for the duration of the fieldwork included Cefas marine ecologists, marine surveyors, marine habitat mappers and GIS specialists along with MPA specialists from the JNCC.

1.2 Then get in touch with our Site Description

Mid St Georges Channel rMCZ is located in the offshore waters of the Irish Sea, 23 km (12.3 nm) from the coast of Wales. It is situated between Irish offshore waters to the west and Welsh territorial waters to the east. The depth of the site ranges from 60 – 125 m.

(For a detailed site description see Final recommendations for Marine Conservation Zones in the Irish Sea 2011)

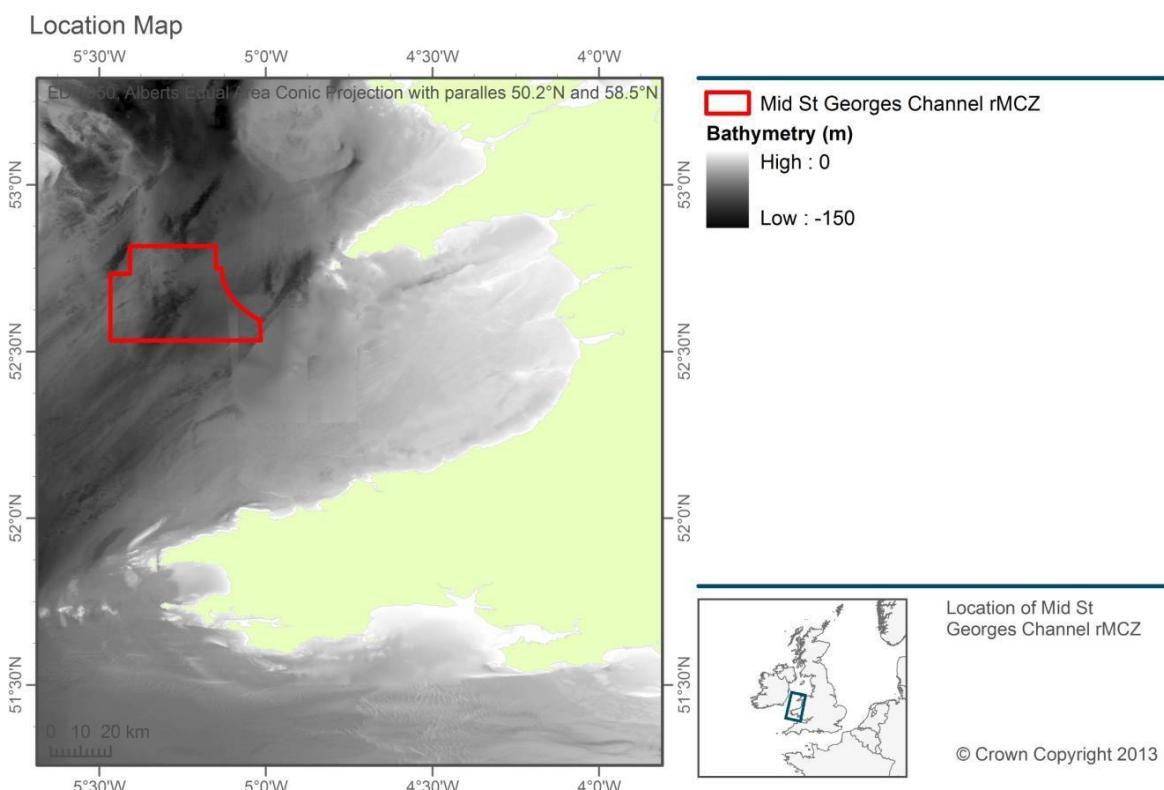

Figure 1. Location of Mid St Georges Channel rMCZ. [Bathymetry is from the Defra Digital Elevation Model (Astrium, 2011)].

1.3 Geological and Biological Context

A number of Broad Scale Habitat (BSH) features and Features of Conservation Interest (FOCI) have been proposed for designation within the rMCZ (Table 1).

Table 1. Features proposed for designation within Mid St George's Channel rMCZ.

Feature Type	Feature Name
Broad Scale Habitat (BSH)	A4.2 Moderate energy circalittoral rock
	A5.1 Subtidal coarse sediment
	A5.2 Subtidal sand
	A5.4 Subtidal mixed sediments
	A5.6 Subtidal biogenic reef

Features of Conservation Interest (FOCI)

Habitats	Subtidal Sands and Gravels*
----------	-----------------------------

*Subtidal sands and gravels are considered to be adequately protected by its component habitat features subtidal sand and/or subtidal coarse sediment, and is no longer included within MCZ designations.

No additional broadscale habitat features or features of conservation importance were identified to be present, but not proposed as part of the designation of this site (Table 2).

1.4 Existing data and information utilised to inform survey planning

Corridor Multibeam bathymetry data collected under the auspices of the Mid Irish Sea Project (2007) in addition to full-coverage Multibeam bathymetry data collected through the 'Invitation to Tender '(ITT) process were utilised during the planning of the ground-truthing survey at Mid Saint Georges Channel rMCZ.

Map showing existing Multibeam bathymetry data at Mid St Georges Channel rMCZ

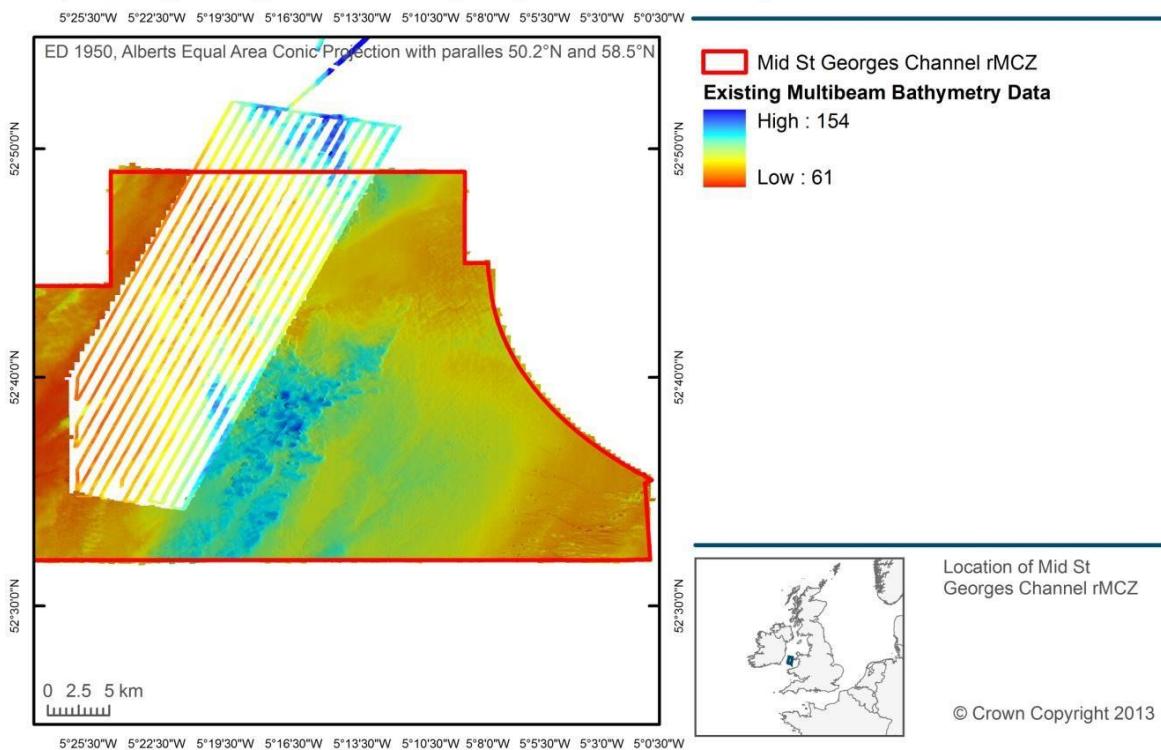

Figure 2. Existing data sources of relevance to informing the survey design at the Mid St George's Channel rMCZ.

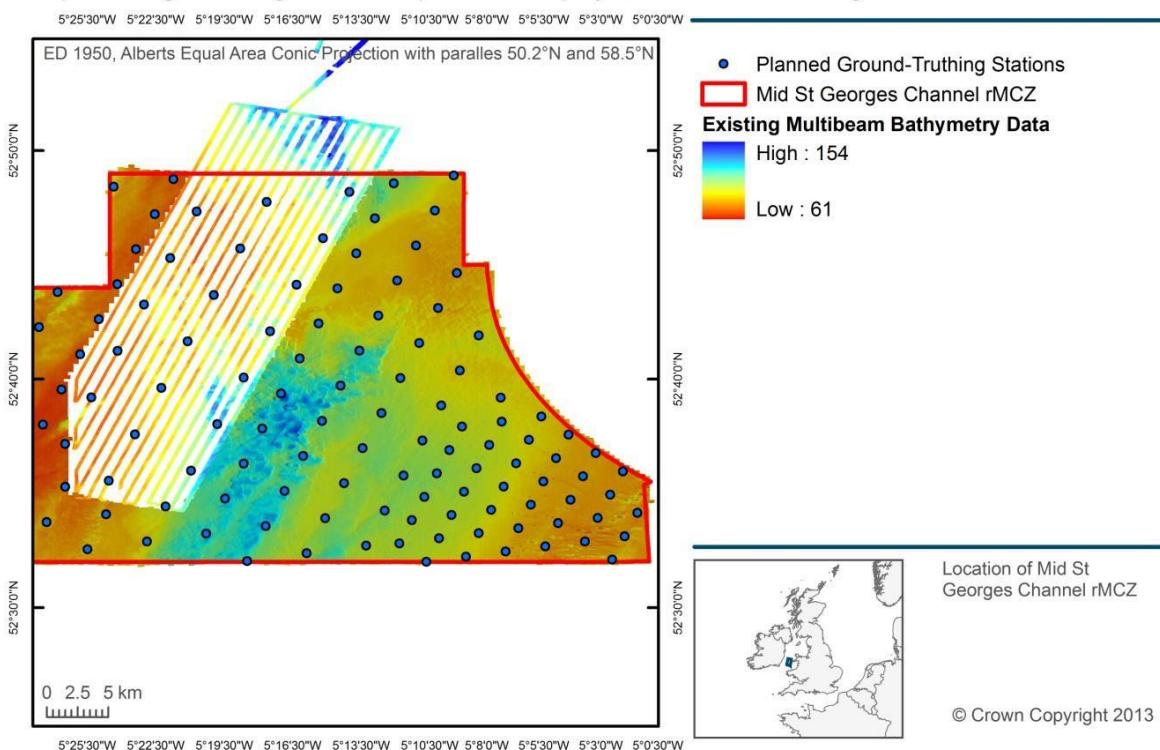

2 Survey Design and Methods

2.1 Survey planning and design

A standard MCZ ground-truthing sampling grid was applied to different habitat types identified from the processed bathymetry and backscatter layers previously collected during the ITT. Station positions were then modified to target features of interest, in particular suspected reef features.

Camera tows were planned at a subset of stations, approximately a third of the total number of ground-truthing stations. Additional camera stations specifically targeting potential reef areas were also planned. The HamCam was employed to collect samples from sedimentary habitats (Figure 5). A minimum of 15 and a maximum of 30 ground-truthing stations were targeted within each broadscale habitat identified during the interpretation of the existing Multibeam bathymetry and backscatter data collected during the ITT.

**Figure 3. Planned ground-truthing survey at Mid St Georges Channel rMCZ.**

2.2 Sample collection and processing methods

2.2.1 Sedimentary Broad Scale Habitats

Sedimentary habitats were ground-truthed by grab and underwater camera. The grab system comprised a 0.1 m² mini Hamon grab fitted with a video camera (Figure 3), the combined gear being known as a HamCam. This allowed an image of the undisturbed seabed surface to be obtained for each grab sample. On recovery, the grab was emptied into a large plastic bin and a representative sub-sample of sediment (approx. 0.5 litres) taken for Particle Size Analysis (PSA). The sample was stored in a labelled plastic container and frozen ready for transfer to a laboratory ashore.

The remaining sample was photographed and the volume of sediment measured and recorded. Benthic fauna were collected by washing the sample with sea-water over a 1mm sieve. The retained >1mm fraction was transferred to a labelled container and preserved in 4% buffered formaldehyde for later analysis ashore.

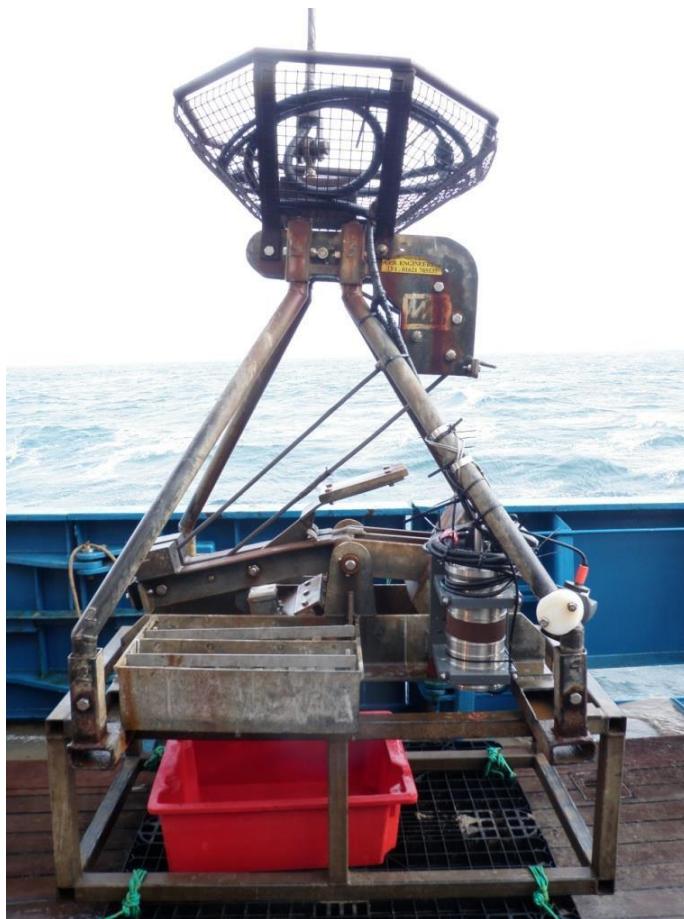

Figure 3. Mini Hamon grab with video camera (HamCam).

The camera sledge system comprised a video camera with capability to also capture still images (Figure 4). Illumination was provided by two Cefas high intensity LED striplights and a flash unit. The camera was fitted with a four-spot laser-scaling device to provide a reference scale in the video image. Set-up and operation followed the MESH 'Recommended Operating Guidelines (ROG) for underwater video and photographic imaging techniques'. Video was recorded simultaneously to a Sony GV-HD700 DV tape recorded and a computer hard drive. A video overlay was used to provide station metadata, time and GPS position (of the vessel) in the recorded video image.

Camera tows lasted a minimum of 10 minutes, with the sledge being towed at ~ 0.5 knots ($\sim 0.25\text{ms}^{-1}$) across a 50 m 'bullring' centred on the sampling station. Stills images were captured at regular one-minute intervals and opportunistically if specific features of interest were encountered. The sledge was controlled by a winch operator with sight of the video monitor and note made of the amount of tow cable deployed to allow a 'lay back' to be applied to estimate the distance of the sledge behind the vessel.

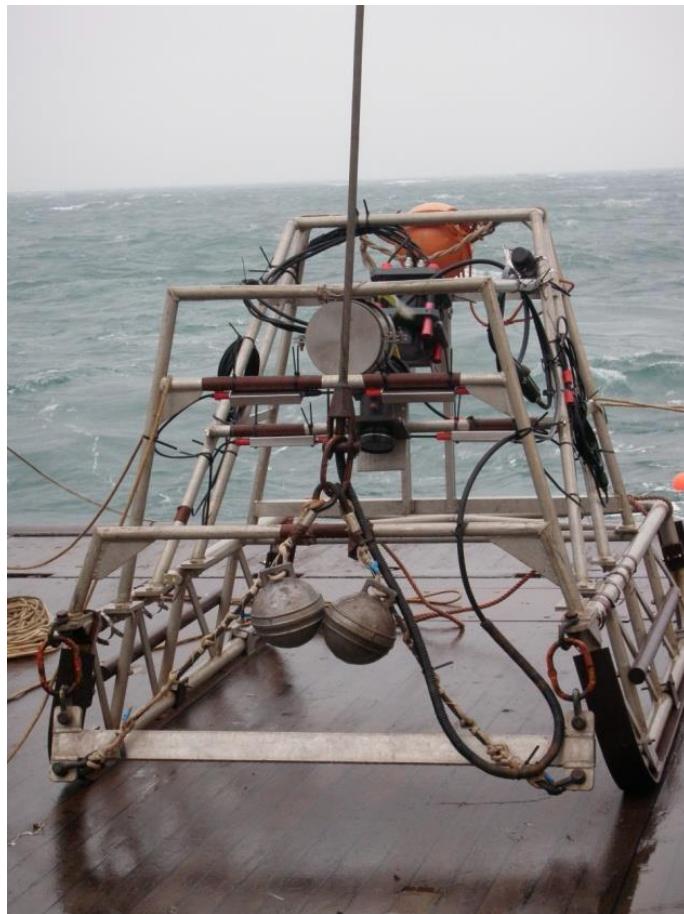

Figure 4. Camera sledge with video and still imaging system.

2.2.2 Circalittoral Rock Broad Scale Habitats

A drop-camera system was available for sampling stations where a hard substrate was predicted by the SAD or observed in the acoustic survey. The system specification was similar to that used on the camera sledge (as described above) but mounted in a rectangular drop-frame (Figure 5) and deployed from the side gantry, amidships. Deployments lasted a minimum of 10 minutes, with the vessel executing a controlled drift at ~ 0.5 knots (~ 0.25 ms^{-1}) across a 50 m 'bullring' centred on the sampling station. Stills images were captured at regular one-minute intervals and opportunistically if specific features of interest were encountered. The height of the camera off the seabed was controlled by a winch operator with sight of the video monitor.

Figure 5. Drop camera frame fitted with video and still imaging system

3 Survey Narrative

Survey work began at the Mid St George's Channel rMCZ on 01/05/13 at 07:19 (01/05/13). On arrival at the site survey work commenced on the ground-truthing programme (Hamon grab and Drop Camera survey). To increase the number of 'regular' stills collected from this site, short (2 minute) DC deployments were carried out more frequently and in addition to the planned standard (10 minute) DC deployments. The ground-truthing survey was completed 05/05/13. In areas of the site where less than 100% multibeam data coverage existed additional Multibeam bathymetry and backscatter data were collected during transits between ground-truthing stations.

On completion of the ground-truthing survey two additional blocks of Multibeam bathymetry and backscatter data were surveyed (data not available for inclusion in this report). On completion of the acoustic survey Cefas Endeavour docked in Swansea at 15:00, 06/05/13.

4 Preliminary Results

4.1 Acoustic Maps

Acoustic data (transects between ground-truthing stations and survey acoustic survey blocks) were not processed at the time this report was written.

Preliminary observations of the sediments collected during the ground-truthing survey (Tables 3 and 4) identified high and moderate energy rock, coarse and mixed sediments. It should be emphasised that this assignment of EUNIS classification is purely subjective and could change as a result of subsequent laboratory analysis and interpretation.

Side Gantry	7.5 tonne articulated side A-frame
Stern Gantry	25 tonne stern A-frame
Winches	3 x cranes 35 tM, heave compensated 2 x trawl winches 2 x drum winches, (1 double) Double barrel survey winch with motion compensation and slip rings Double barrel survey winch with slip rings Double barrel towing winch with slip rings Side-scan sonar winch with slip rings 3 x Gilson winches (one fitted to stern A-frame)
Transducers/Sea tube	Drop keel to deploy transducers outside the hull boundary layer in addition to hull mounted transducers 1.2 m diameter sea tube/moon-pool
Acoustic equipment	Kongsberg Simrad: HiPAP 500 positioning sonar EK60, 38/120 kHz scientific sounder EA 600, 50/200 kHz scientific sounder Scanmar net mensuration system SH80 high frequency omni- directional sonar EM3002 swathe bathymetry sounder Hull mounted Scanmar fishing computer transducers
Boats	2 x 8m rigid work and rescue boats with suite of navigational equipment deployed on heave-compensated davits
Laboratories	8 networked laboratories designed for optimum flexibility of purpose 4 serviced deck locations for containerised laboratories
Special features	Dynamic positioning system Intereng anti-roll system Local Area Network with scientific data management system Ship-wide general information system CCTV
Class	LRS 100A1+LMC UMS SCM CCS ICC IP ES(2) DP(CM) ICE class 2

5.2. Camera sledge and Drop Camera

Flash model: Kongsberg 11-242

Underwater lights – Cefas high power LED strip lights

Video and stills camera settings variable depending on underwater visibility and ambient light levels.

5.3. Positioning Software-Tower

Vessel offsets are defined from the pitch roll centre of the vessel – the Common Reference Point (CRP) used by the Tower CEMAP software to calculate offsets.

5.4. Multibeam Bathymetry

Model: Kongsberg EM3002D

Frequency: 300kHz; swathe width variable running in hi res equidistant mode

Latency correction not determined – 1pps synchronised time system utilised on vessel.

5.5. Metadata

Station metadata for the North St George's Channel rMCZ survey on CEND 03/12 are provided below. Stn No is a sequential event number for the cruise, so changes each time a new gear is used or a new location sampled. Stn Code is used to identify the sampling location. CTD=Conductivity, Temperature, Depth micrologger, MB=Multibeam, HC=HamCam, CS=Camera Sledge, DC=Drop Camera.

5.5.1. HamCam

5.7. *Fisheries Liaison Officer (FLO) Report*

No fishing activity was observed during the survey of the North St George's Channel rMCZ during the survey CEND 03/12.

About us

Cefas is a multi-disciplinary scientific research and consultancy centre providing a comprehensive range of services in fisheries management, environmental monitoring and assessment, and aquaculture to a large number of clients worldwide.

We have more than 500 staff based in 2 laboratories, our own ocean-going research vessel, and over 100 years of fisheries experience.

We have a long and successful track record in delivering high-quality services to clients in a confidential and impartial manner.

Cefas Technology Limited (CTL) is a wholly owned subsidiary of Cefas specialising in the application of Cefas technology to specific customer needs in a cost-effective and focussed manner.

CTL systems and services are developed by teams that are experienced in fisheries, environmental management and aquaculture, and in working closely with clients to ensure that their needs are fully met.

Customer focus

With our unique facilities and our breadth of expertise in environmental and fisheries management, we can rapidly put together a multi-disciplinary team of experienced specialists, fully supported by our comprehensive in-house resources.

Our existing customers are drawn from a broad spectrum with wide ranging interests. Clients include:

- international and UK government departments
- the European Commission
- the World Bank
- Food and Agriculture Organisation of the United Nations (FAO)
- oil, water, chemical, pharmaceutical, agro-chemical, aggregate and marine industries
- non-governmental and environmental organisations
- regulators and enforcement agencies
- local authorities and other public bodies

We also work successfully in partnership with other organisations, operate in international consortia and have several joint ventures commercialising our intellectual property
