Biodiversity Indicators Production Team (Defra)

October 2021

Section 1 of this document describes the methodology used in determining estimates of UK public sector spending on biodiversity in the UK and the rest of the world. The indicators are based on a combination of estimates and expert opinion with judgment employed to finalise some components of the total. The figures should be taken as approximate.

Section 2 describes the methodology used to determine estimates of spending by non-governmental organisations (NGOs), with a main focus on biodiversity and/or nature conservation, in the UK. The indicators are based on a combination of published and unpublished estimates, with judgment employed to finalise some components of the total. The figures should be taken as approximate.

Methodology

1. All total expenditure figures in this indicator are presented as financial year data and 2019/20, for example, refers to the period April 2019 to March 2020.
2. Two main sources are used to obtain information for the indicators from a wide range of government organisations; departmental annual reports; and expert contacts in the relevant organisations.
3. Spending on biodiversity is disaggregated where possible between:
 - Spending directly on nature reserves and conservation measures;
 - Related spending on administration and training;
 - Relevant research and development; and
 - Transfer payments to other organisations (in order to remove double counting of financial flows).
4. Direct conservation consists of activities that directly protect and promote variety among living organisms. However, direct action is often ineffective unless supported by a range of other activities such as research and development, education and publicity, or even simply administration. Sources of information may not always distinguish between these elements and it is necessary to exercise judgment as to when an item should be included or not, or whether the relevant component relating to direct action should be estimated by expert judgment or by reference to other information. For simplicity, the staff costs associated with implementing biodiversity focused programmes within large organisations are not included.
5. In practice, because biodiversity spending is not always separately identified within the available sources, or if a single expenditure item includes biodiversity and non-biodiversity elements, an aspect of judgment is sometimes required. One particular example is the treatment of expenditure through the four countries' (England, Scotland, Wales and Northern Ireland) agri-environmental schemes, where an estimate is made of the proportion of total scheme spending that is biodiversity-related.
6. Given the large number of UK public sector organisations funding activities related to biodiversity and the complexities involved in both defining and identifying relevant expenditure, the figures presented in this indicator are likely to be an underestimation of total biodiversity spend by the UK public sector. They do however provide a clear trend of expenditure on biodiversity since the beginning of 2000/01 (domestic) and 2001/02 (international). The time series for the international measure was shortened by one year during the 2019 update of this indicator. This was because the limited availability of Official Development Assistance (ODA) data for 2000/01 was leading to issues of discontinuity.
7. A further difficulty is that many expenditure items are designed to meet more than one policy objective: an example is tree planting, which promotes biodiversity but might be largely driven by a demand for landscaping. In practice, the assessment by relevant experts of the appropriate share of any spending which can be attributed to biodiversity needs to take into account issues such as the quality of conservation measures and the original intentions of the expenditure.
8. Finally, given the time period covered by this indicator, it is inevitable that government organisations will be restructured, funding streams will change, projects will come to an end and/or new projects will begin and some biodiversity related expenditure will be outsourced to external organisations. Therefore, although every effort is made to

consistently report annual expenditure, there are likely to be some differences in the coverage of the indicator from one year to the next.

Definitional issues concerning spending on biodiversity in the UK

Access to the countryside

9. Expenditure on providing access to the countryside has generally been regarded as being for the benefit of society rather than in support of biodiversity. An exception is made for spending on nature reserves, which will include spending on visitor centres and footpaths, but which can be regarded as being for educational and fund-raising purposes. Where expenditure on access is identifiable (for example, expenditure by the Forestry Commission which is specifically allocated to access but not to nature reserves) this is excluded.

Expenditure on National Parks

10. Much of the spending by the 15 National Parks in England, Scotland and Wales is geared towards services for the public, including access, landscaping etc. However, some specific expenditure in the form of contributions to Local Biodiversity Action Plans (LBAPs) and other activities has been identified. There is also some relevant expenditure that is funded by the agriculture departments in each country. It has not been possible to gather biodiversity-related expenditure from the majority of National Parks due to various reasons but expenditure on agri-environment schemes within National Parks by each country's relevant departments is captured.

Natural resource management

11. The following spending is excluded on the grounds that it is aimed at managing the use of the environmental assets for the economy, rather than for the protection and enhancement of biodiversity:

- Spending by the Environment Agency on water abstraction licenses
- Spending by the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) on the management of the fishing industry, and
- Spending by the Forestry Commission on the management of commercial forests.

Forestry Commission expenditure

12. Gross expenditure by the Forestry Commission is included, in respect of the broad objective that includes biodiversity in the annual accounts for the Forestry Commission in England, Wales and Scotland; each includes a diverse range of activities in addition to the biodiversity-related activities outlined below. A typical activity is the expansion of native woodland, as this is an important habitat to native animal and plant species. Other activities include SSSI management, creating linkages to isolated woodland remnants and woodland glade management for key moth and butterfly species living in the forests.

Road schemes

13. Biodiversity protection expenditure has not in the past been separately estimated by the Highways Agency (for the Department for Transport). However, since 2005/06 the Agency has had a separate budget specifically allocated to the overall achievement of the Biodiversity Action Plan targets. It is believed that prior to 2005/06, the (unallocated)

spending on biodiversity was significantly lower. No estimates have been made for these years, therefore some discontinuity will occur.

Landscape

14. Estimates of expenditure on land management regarding Sites of Special Scientific Interest (SSSIs), National Nature Reserves and other protected land areas are included. However, wherever possible expenditure relating to landscaping is excluded, as the main focus of this activity is for aesthetic reasons.

Definitional issues concerning spending on international biodiversity

Spending in the UK's Overseas Territories

15. Public sector spending on international biodiversity includes spending by the UK in the Overseas Territories. Spending on the Overseas Territories Environmental Programme (OTEP) is provided by the Foreign and Commonwealth Office (FCO) and the Department for International Development (DfID), whilst other spending is carried out by Defra, Joint Nature Conservation Committee (JNCC) and the Ministry of Defence (MoD).

Wildlife trade and international wildlife crime

16. Estimates of departmental costs involved in monitoring and controlling the trade in endangered species (CITES) are included.

Spending on international aid as part of wider initiatives

17. A number of relevant programmes have been identified and allocated to biodiversity. These schemes include Darwin and Darwin Plus (Defra), the Flagship Species Fund (Defra), the Global Opportunities Fund (FCO) and ODA by way of contributions to the Global Environment Facility (GEF) (DfID and since 2017/18, Defra). Given the broad coverage of the latter, an assumption is made that 33% of the payments relate to biodiversity. The irregular timing of payments to the GEF also mean that the values reported in this indicator can vary considerably from one year to the next. There are years where no payments are reported and there are years where two payments are reported. Elsewhere within this indicator, payments such as these would be allocated to the appropriate year on an accruals basis, thereby smoothing out any peaks and troughs. Payments to the GEF, however, are recorded with HM Treasury as ODA at the time they are made rather than the period they relate to so it is not possible to apply an accruals approach here.

Financing issues

EU funding of UK biodiversity

18. Financing from the EU, for example, funding to agri-environment schemes, is included in this indicator so total figures are for spending on UK biodiversity irrespective of which public body the money comes from.

National Lottery funding

19. National Lottery funding from both the Heritage Lottery Fund and the Big Lottery Fund is classified as government spending on the grounds that government bodies decide who and what to fund. The People's Postcode Lottery is not currently included.

Areas of expenditure on biodiversity in the UK not currently included in this indicator

20. There are a number of areas where funding for biodiversity in the UK is not currently included in this indicator. Examples of this include spending on local nature reserves and nature conservation by local authorities. Where gaps are identified, they can only be resolved if robust data from reliable sources are available across the entire time series for that particular funding stream, otherwise the trend assessment (particularly over the long term) will be affected.

Areas of expenditure on international biodiversity not currently included in this indicator

21. The 2021 iteration of this indicator captures the international financial flows most closely associated with the conservation of biodiversity. However, there are additional funding streams that contribute to the achievement of Aichi targets that have not been captured to date. For example, the UK is a world leader in research including that on the natural environment. Whilst this research demonstrates progress towards target 19 as well as underpinning action to achieve the Aichi targets more broadly, not all of it is captured within the figures. The UK is currently reviewing its reporting of international biodiversity financial flows, and aims to provide this additional information in future reports. Again, omissions from the international indicator can only be resolved if robust data from reliable sources are available across the entire time series for that particular funding stream.

Assumptions and adjustments made to the data

22. Where the relevant data are available, expenditure figures relating to biodiversity protection are separated out from general environmental spending. When this breakdown is not possible, estimates are made as to how much of the total spending can be attributed towards biodiversity protection. These estimates are mostly made through contacts within the organisations concerned, ideally by the person responsible for the relevant programme.

23. Although this process should mean that all relevant spending is captured, it does mean that we are sometimes dependent upon expert judgment which can have limitations. The process by which experts arrive at their judgment may not be documented, and subsequent assessments may not be made on a consistent basis. Also, these experts may have a different view of what constitutes spending on biodiversity and hence the estimates they supply may not always be directly comparable. We do try to maintain consistency by asking experts to explain/justify the reasons for any change in the estimated proportion of spend going on biodiversity.

24. There are a few cases where it has not been possible to obtain an expert view of the biodiversity-related proportion of the total spend of a scheme. In these cases, a judgment has been made based on the description of the scheme's priorities.

25. Where possible, the data included in this indicator are reported on a financial year basis; however, contributions to the GEF and other ODA expenditure are reported by calendar year. For the purpose of this indicator, they have been allocated to the financial year beginning in each relevant calendar year, for example, 2019 data are included in 2019/20.

Spending by police forces on Wildlife Crime Units

26. The only Wildlife Crime Units are the National Wildlife Crime Intelligence Unit in the National Criminal Intelligence Service, mainly funded by Defra, and the Wildlife Crime Unit in the Metropolitan Police.

27. Other police forces do have individuals who are wildlife crime leads in their area; in some cases these may be referred to as units. Some officers work full time as wildlife crime officers, others incorporate wildlife crime duties in with work on other crime issues. No estimates of these costs are made.

28. Spending by the Metropolitan Police is difficult to capture as no separate budgets for wildlife crime were allocated until 2004/05. Costs noted are estimated staff costs supplied by the Metropolitan Police. Spending in earlier years is assumed to be negligible on the understanding that prior to 2004/05 much of the work was either carried out in the individuals' own time or while they were engaged in other duties.

Indicator assessment

29. The Gross Domestic Product (GDP) deflator is a measure of general inflation in the domestic economy – it captures the price changes over a period of time. The deflator is expressed in terms of an index number. It is used here to convert historic prices into constant prices, thereby allowing meaningful comparisons to be made between biodiversity expenditure in different years. The base year is always set to the most recent year of data available in the time series, therefore, data presented in the current publication are not directly comparable to those in previous publications because a new deflator is used to prepare each annual update.

30. Once the time series for each UK public sector spend indicator (domestic and international) has been deflated, assessments are made by comparing the difference between the value of the measure in the base year and the value in the end year against a 3% 'rule of thumb' threshold. A 3-year average is used to calculate the base year, to reduce the likelihood of any unusual year(s) unduly influencing the assessment.

31. Where the indicator value has changed by less than the threshold of 3%, the traffic light will be set at amber, otherwise it will be set at either red (decreasing) or green (increasing). The choice of 3% as the threshold is arbitrary but is commonly used across other government indicators; the use of this approach will be kept under review.

32. The traffic lights only reflect the overall change in the measure from the base year to latest year and do not reflect fluctuations during the intervening years. Two assessment periods have been used for both UK public sector expenditure measures:

1. Long-term – an assessment of change since the earliest date for which data are available (2000/01 for the domestic measure and 2001/02 for the international measure), and
2. Short-term – an assessment of change over the latest five years.

33. The public sector expenditure indicators also have a third marker showing the direction of change in the latest year. This period is too short for any meaningful assessment to be made. However, when the change exceeds a 1% threshold, the direction of this change is given simply as an acknowledgement of very recent trends and as a possible early indication of emerging trends.

Indicator revisions: UK

The Community Forests

34. The expenditure on biodiversity by the Community Forest that was previously included in the domestic measure was removed from the entire time series as part of the 2019 update. This was due to concerns over the continuity of reporting across all years. Compared to the figures reported in 2018 and those that would have been reported at the time, this revision resulted in real-term reductions to reported annual expenditure of between £19.2 million in 2000/01 and less than £1 million in 2015/16 to 2017/18 (all figures given in 2017/18 prices).

Agri_environment schemes

35. Historical payments made to farmers and land managers in the UK via agri-environment schemes were revised during the 2019 update. The percentage of these payments made to farmers and land managers in England that is considered to be of benefit to biodiversity was also revised. Payments under these schemes in the four countries are now more closely aligned with those reported in '[Agriculture in the United Kingdom](#)' although some inconsistencies still exist because of differences in reporting years (financial in the Biodiversity Indicators and calendar in Agriculture in the United Kingdom); the treatment of payments for capital items; and the proportions of these payments considered to be of benefit to biodiversity. Up to and including the 2018 indicator publication, the percentage of payments made via agri-environment schemes in England that was considered of benefit to biodiversity and hence included in this indicator was 70% between 2000/01 and 2010/11 and 55% between 2011/12 and 2016/17. These estimates were revised during the 2019 update and the 70% assumption is now applied consistently across the entire time series from 2000/01 through to the current publication.

36. At the time these changes were made, they resulted in real-term increases in the indicator of between £4 million and £9 million in the earlier years of the time series (2000/01 to 2005/06); £6 million and £33 million in the middle years (2006/07 to 2010/11) and £71 million to £99 million in the later years (2011/12 to 2016/17) when compared to the figures reported in the 2018 publication (all figures given in 2017/18 prices).

Indicator revisions: international

ODA funding for projects of benefit to biodiversity and forestry

37. Additional ODA funding for projects of benefit to biodiversity and forestry were included in the international measure for the first time during the 2019 update of this indicator. Given the length of the time series, figures for annual expenditure on these projects were gathered from different sources: first, from data submitted to the OECD for 2002 (2002/03) to 2005 (2005/06) and second, from the figures reported to the Convention on Biological Diversity (CBD) for 2006 (2006/07) to 2016 (2016/17). Data for 2002 to 2005 were sourced in US dollars and converted in to pounds sterling using mid-year exchange rates from HM Revenue & Customs. Some judgement was employed in order to identify the relevant biodiversity and forestry related elements of the total ODA expenditure. Estimates based on the mean of 2002 to 2005 data were used in 2001 (2001/02) and the time series was shortened by one year in order to overcome the issues of missing data in 2000 (2000/01). ODA expenditure for 2017 that were due to be reported to the CBD in the final quarter of 2019 were also included in the indicator for 2017/18.

38. ODA funding for biodiversity and forestry related projects shows considerable year-on-year variation and given the magnitude of these payments, has a noticeable knock-on effect on the final indicator values. One reason for this is that ODA funding reported in a particular year may relate to multi-year projects. Elsewhere within this indicator, payments such as these would be allocated to the appropriate year on an accruals basis, thereby smoothing out any peaks and troughs. However, like GEF funding, other ODA payments are recorded with HM Treasury at the time they are made rather than the period they relate to, so it is not possible to apply an accruals approach here either.

39. At the time, compared to the 2018 publication, including this additional ODA funding resulted in real-term increases in the total figures for expenditure on international biodiversity across the entire time series. The magnitude of these increases ranged from £13 million in 2008/09 to £143 million in 2015/16 (in 2017/18 prices). While temporarily put on hold for the 2020 and 2021 updates, it is hoped that future development work will lead to improvements in the overall accuracy of these estimates.

Latest year's change in indicator value: UK

40. Real-term public sector spending on UK biodiversity increased from £491 million in 2018/19 to £502 million in 2019/20 (in 2019/20 prices), a latest-year increase of 2%.

41. Payments made to farmers and land managers under agri-environment schemes account for more than half (56% in 2019/20) of annual public sector spending on biodiversity in the UK. However, total payments under these schemes fell in 2019/20 and the observed increase in this year's indicator is mainly due to increased contributions from the Heritage Lottery Fund, the Environment Agency (England) and Nature Scotland.

42.

Latest year's change in indicator value: international

43. Real-term public sector spending on international biodiversity increased from £153 million in 2018/19 to £175 million in 2019/20 (in 2019/20 prices), a latest-year increase of 14%. Annual changes in this measure are influenced greatly by the irregular nature of (i) contributions to the Global Environment Facility (GEF) and (ii) other Official Development Assistance (ODA) funding. As previously noted, it is not possible to apply the accruals approach here because of the way that these payments are recorded with HM Treasury as ODA at the time they are made rather than the period they relate to.

Section 2: Non-governmental organisation spending

Contents

Background.....	12
Methodology	12
Indicator assessment.....	14
Further information.....	15
NGOs included in the indicator.....	15

Background

1. Prior to 2014, the expenditure indicator included in the Biodiversity Indicators publications only covered public sector expenditure, and so did not fully represent total expenditure on biodiversity. In 2014, Defra statisticians developed an additional measure of non-governmental organisation (NGO) spend on biodiversity (net of government funded spend). NGO support for and action on biodiversity is vitally important; capturing the contribution of NGOs is a key element of tracking the UK's conservation efforts. In addition, this new measure is likely to account for a large part of the funding from businesses and private individuals that is channeled through the NGOs. Including this source of expenditure will give a more complete picture of spending on UK biodiversity.

Methodology

2. All total expenditure figures presented in this indicator are financial year (that is, April to March) data.

NGO selection

3. NGOs with a primarily biodiversity or nature focus were selected for inclusion in this indicator. Many of the NGOs selected are members of the organisation Wildlife and Countryside Link. Link is an umbrella body, whose purpose is to bring together voluntary organisations in the UK to protect and enhance wildlife, landscape and the marine environment. Focusing on Link members gives a suite of significant NGOs pre-selected for their focus on biodiversity and nature protection. In addition, 13 of the 47 Wildlife Trusts with the highest annual turnover in England and Scotland have been included in this indicator, as well as NGOs that are not members of Link, but have a biodiversity and/or nature focus (British Trust for Ornithology, The British Association for Shooting and Conservation and the Game & Wildlife Conservation Trust). A full list of organisations included in the indicator can be found at the end of this section. Organisations that focus on animal welfare or conduct the bulk of their work abroad are included, however expenditure by the three NGOs in the indicator providing the greatest financial contributions to biodiversity in other countries (RSPB, WWF-UK and the Zoological Society of London (ZSL)) has been adjusted accordingly.

Data collection

4. To avoid placing reporting burdens on NGOs, data is collated predominantly from NGO published annual accounts/financial reports. Almost all of the NGOs included in this indicator are registered as charities and detailed annual financial reports are published on the [Charity Commission website](#). In a small number of cases data, or a more refined

estimate of expenditure, is collected from the organisation directly, examples of this include the estimates used to apportion spend by the RSPB, WWF-UK and ZSL between work in the UK and work abroad.

5. For consistency with the public sector stream, staff costs associated with administering biodiversity focused programmes are not included.

6. For the majority of NGOs, the total amount of money spent on 'Charitable Activities', documented in the 'Resources Expended' section of the 'Consolidated Statement of Financial Activities' (present in each NGO annual report) is used as a first estimate of annual biodiversity spend.

7. In practice, because biodiversity spending is not always separately identified within the available sources, or if a single expenditure item includes biodiversity and non-biodiversity elements, an aspect of judgment is sometimes required.

8. A further difficulty is that many expenditure items are designed to meet more than one policy objective: an example is tree planting, which promotes biodiversity but might be largely driven by a demand for landscaping. In practice, the assessment by relevant experts of the appropriate share of any spending which can be attributed to biodiversity needs to take into account issues such as the quality of conservation measures and the original intentions of the expenditure.

9. If organisations fail to supply data in a given year, estimates are made based on the mean of the previous three years data. For the 2021 publication, two organisations failed to supply data/apportionment of expenditure for 2019/20: British Association of Conservation and Shooting and the ZSL.

Avoiding double counting of public sector grants

10. It is necessary to avoid double counting of grants and other payments (for example, research contracts) coming from the government to NGOs, as these are already accounted for in the public sector stream of the indicator. Many NGOs list grants received and the value of these grants in their statement of financial activities. Where this is the case, it is possible to identify grant providers that are already in the public sector indicator and calculate the proportion of a NGO's total income that is from these organisations. The first estimate of the NGO's expenditure on biodiversity is multiplied by the proportion of total income not from these organisations in the appropriate year. This gives a final estimate of biodiversity expenditure funded from non-government sources for each NGO.

11. Itemised grants are not always available in the published accounts. In most of these cases, no correction is made to the NGO estimate of total expenditure as the contribution of the particular individual NGO to the total NGO spend is very small. In cases where the contribution of an NGO without grant information to the overall indicator is significant (more than 1% of the total expenditure), that organisation is contacted directly to obtain grant information, in order that their estimates of expenditure can be refined.

12. It has been assumed that grants and expenditure relate to the same time period.

Calculating total NGO expenditure

13. Total NGO expenditure on biodiversity in the UK is calculated as the sum of the individual estimates of expenditure for all of the NGOs included in the indicator. At present, we have estimated NGO expenditure on biodiversity for 10 years, 2010/11 through to 2019/20. In keeping with the public sector strand of this indicator, final estimates of total

NGO expenditure are deflated using the UK Gross Domestic Product (GDP) Deflator to ensure spend is expressed in real terms.

14. Given the time period covered by this indicator, it is inevitable that organisations will be restructured, funding streams will change and projects will come to an end and/or new projects will begin. Therefore, although every effort is made to consistently report annual expenditure, there are likely to be some differences in the coverage of the indicator from one year to the next.

15. Finally, given the limited number of NGOs included within this measure and the complexities involved in both defining and identifying relevant expenditure, the figures presented in this indicator are likely to be an underestimation of total biodiversity spend by UK NGOs. They do however provide a clear trend of expenditure on biodiversity since the beginning of 2010/11

Spending on international biodiversity by NGOs

16. Due to internal resource constraints, this work has been limited to domestic biodiversity expenditure in the first instance.

Indicator assessment

17. The Gross Domestic Product (GDP) deflator is a measure of general inflation in the domestic economy – it captures the price changes over a period of time. The deflator is expressed in terms of an index number. It is used here to convert historic prices into constant prices, thereby allowing meaningful comparisons to be made between biodiversity expenditure in different years. The base year is always set to the most recent year of data available in the time series, therefore, data presented in the current publication are not directly comparable to those in previous publications because a new deflator is used to prepare each annual update.

18. Once the time series for the NGO spend indicator has been deflated, assessments are made by comparing the difference between the value of the measure in the base year and the value in the end year against a 3% 'rule of thumb' threshold. A three-year average is used to calculate the base year, to reduce the likelihood of any unusual year(s) unduly influencing the assessment.

19. Where the indicator value has changed by less than the threshold of 3%, the traffic light will be set at amber, otherwise it will be set at either red (decreasing) or green (increasing). The choice of 3% as the threshold is arbitrary but is commonly used across other government indicators; the use of this approach will be kept under review.

20. The traffic lights only reflect the overall change in the measure from the base year to latest year and do not reflect fluctuations during the intervening years. To date, it has only been possible to calculate a short-term assessment (change over the last five years) for the NGO measure. Once data are available for at least 10 years, a long-term assessment will also be calculated for the measure.

21. The NGO spend indicator also has a third marker showing the direction of change in the latest year. This period is too short for any meaningful assessment to be made. However, when the change exceeds a 1% threshold, the direction of this change is given simply as an acknowledgement of very recent trends and as a possible early indication of emerging trends.

22. Spending on biodiversity in the UK by non-governmental organisations (NGOs) with a focus on biodiversity and/or nature conservation was £266 million (net of government funding) in 2019/20, a latest-year change of 1%. There was a 17% real-term increase in biodiversity related spending over the last five years and a 34% increase in spending since the time series began in 2010/11.
